Hi that is not any file, that is a void function
to set (reset?) the members functions to zero(?).

I have seen you call directly delete, after having added a hit
in your TpcPoint collection.

I have written that, because some days ago i had some problem
with MCTrack, i got some strange track ids not recognized by the
program.

I have solved this problem, by setting everything to zero as Ralf did for the MVD and not to
-999 as i had before.

And after the Stephano comment i hope it doesn't create any problem.

cheers alicia
