Hi

I think i understand whats going on. In the Shell script we define PATH and LD_LIBRARY_PATH in the following way

```
export PATH=${PATH}:${ROOTSYS}/bin/  
export LD_LIBRARY_PATH=${LD_LIBRARY_PATH}:${ROOTSYS}/lib/
```

If there is already a root executable or rootcint in the PATH you run into problems. Can you please try to change the lines into

```
export PATH=${ROOTSYS}/bin/${PATH}  
export LD_LIBRARY_PATH=${ROOTSYS}/lib:${LD_LIBRARY_PATH}
```

After that please delete the geant4_vmc directory and run the Shell script again. I hope this changes should do the job.

Ciao

Florian
