Hi Soeren,

this diagram is not up to date anymore, but MvdCluster would correspond to a point in 3-D space and is derived from CbmHit.

I am not very happy with this naming scheme. In my understanding the process of clustering means to find digis which belong to one hit. And a cluster is a collection of these digis. To get out of these cluster again a 3-D point I would call backmapping or reconstruction but not cluster.

Cheers,

Tobias
