I will describe how I stored string in parameter file on example of emc. I don't upload the code to svn, since it was just a test.

1. In PndEmcRecoPar.h defined data member

```
Text_t fEmcClusterPosMetodText[20];
```

2. In PndEmcRecoPar.cxx, in PndEmcRecoPar::putParams(CbmParamList *list)

```
list->add("EmcClusterPosMethodText",fEmcClusterPosMethodText,20);
```

3. In PndEmcRecoPar::getParams(CbmParamList *list)

```
if (!list->fill("EmcClusterPosMethodText",fEmcClusterPosMethodText,20)) return kFALSE;
```

4. In emc.par file defined the line

```
EmcClusterPosMethodText:s lilo
```

And that's it in principle.

Dima
