Subject: DPM generator. Question about mothers and daughters
Posted by Dmitry Morozov on Thu, 07 Feb 2008 12:05:51 GMT

Dear DPM experts!

I would like to have some sample of inelastic events generated by DPM. The goal is to look on kinematics of several processes.
During the simulation I noticed that some decays are forbidden (pi^0, Lambda etc). Yes, it could be decayed later in geant, but i don't need it for now. In principle I can allow decays in init.f file. The problem is then I look in the file generated, by root Browser or by macro, there is no info about mother particles or daughter particles of given one. All I can see is zero...

Is there a way to access this information? Or I do something stupid?

Thank you.
Dmitry.
