Hello,
finally I was able to install fluka and fluka_vmc.

Everything ok, apart that when I try to run a sim_emc.C macro with TFluka option I hadthe following error:

Warning in <TFluka::InitPhysics>:
Cannot open file coreFlukaVmc.inp

I thought, maybe some configuration file is missing somewhere in the PandaRoot repository?

So I copied the file gconfig/run_fluka.sh in my emc directory, and a directory called fluka_out was created.
I moved there, copied my sim_emc.C and run it... and my error went away.

So... FLUKA is now running in the Gießen cluster!
