Dear Mohammad,

I have tested the possibility to import my root geometries with a GeoManager in the file. Unfortunately this fails with the error message:

```
====> GEANT4 materials created and mapped to TGeo ones...  
Cannot make material for volume: TOP  
Aborting in CreateLogicalVolume()
```

```
*** G4Exception: Aborting execution ***
```

Without the GeoManager the import works fine.

I have added both files to the forum entry. The file with "_wG" contains the GeoManager

Cheers,

Tobias
