Hi Stefano!

We have reported on problems with the Energy Loss for G3 vs. G4 soem time ago. I am not surprised that it also shows in the MVD. I would be glad if we could find out what is going on!

However as I wrote last week also G3 has to be mistrusted. At least for Gas detectors the setup which is currently in svn is screwing up.

What is also worrying me in your plots is, that there seem to be two classes of kaons... at least when you look at the region around $p=200\text{Mev}$.

Cheers! Sebastian.
