Hi all,

Last week in a CBM meeting we discuss the SVN structure and the suggested the following structure:

fairroot/cbmroot/trunc: the head version;
fairroot/cbmroot/release: Releases, e. g. fairoot/cbmroot/release/APR08;
fairroot/cbmroot/develop: Subdirectories for larger off-head developments which will eventually be merged back into trunc.

what do you think? would this be also suitable for Panda?

regards

Mohammad
