---

Object oriented programming became available in LabVIEW with version 8.2.

I started a project to create a LVOOP base class library that can serve as a base for LVOOP projects. HGF is an abbreviation for Helmholtz, GSI, FAIR.

Main focus of this library

- How to deal with LabVIEW objects as entities?

- > Factory

- > Named objects

- > Constructor and destructor

- How to prevent unintended object wire forks?

- > Reference, Singleton

- > Object Manager

- > Functional Global Variable & Visitor

- How to deal with Agents?

- > Separation of passive object data and active threads -> Thread Pool

- > Event handling

- How to overcome some technical restrictions?

- > Missing class information

- > Missing overloading -> Variant

- > Missing Multiple Inheritance -> Aggregation

- > Missing Interfaces -> Delegation

A first Version is available. The sources are published with GNU Public License (GPL) and can be downloaded here:

<http://wiki.gsi.de/cgi-bin/view/NIUser/HGFBBaseClassLibrary>

Maybe you like it.

Regards Holger
