Dear all,

in svn you can find the new release of the muon detector, developed together with George, according to our current solenoid design.

The package is now called "MDT" instead of MUO, such as "Muon Detector Tracker" (the original name).

A ideal digitization is also provided.

The macros were added also in svn, and the global macro/run_ macros were also updated. Please remember that libMuo does not exist anymore, but now you have to use libMdt.

Here you are our new sketch (I have no idea on why I am having problems with the Microvertex, maybe it is due to the old geometry).

Bye
