Hi Sebastian,

are you using the `GeaneTrackRep::extrapolate(const DetPlane& pl, TMatrixT<double>& statePred, TMatrixT<double>& covPred, TMatrixT<double>& jacobian)` function? Because in that function I see that when `backprop` is true you call `_geane->setBackProp()` which sets `fPropOption="BLE"` but in that case GEANE would make the back-propagation to a specific tracklength ("L" option), while what we want here is to back-propagate to a plane: so in this case it should be `fPropOption="BPE"`.

Hope this helps,  
Lia.
