Hello,

if I read the media_pnd.geo file, about the "iron" media definition, I find:

```
iron      1 55.847 26. 7.87
          1 1 20. .001
          0
```

The question is: why iron is a "sensitive" volume? Is somebody using iron for his detector, to have MCPoints?
