Dear friends of Pandaroot

I have just arrived to one point
at which one starts to be nervious.

I have realized that by running with
the same generator, same detector but with diffrent
running mode(genat3 or geant4)
there is a big big diffrence.

So lets start to see,
what the hell means all the cuts setups at gconfig/G3config.C setCuts.C

for example, some at the mar08 release the cut on time tof was 1
now if you go to the svn repository trunk is 1E10 (what ??) seconds.

Has this change implications on the simulation???

I will appreciate if some of you can reply to this .

thanks in advance

A. S.
