Hello Volker

In the run.C macro there were still old geometries which results in a crash of the macro. I corrected this and now it works.

But I realized that we have a problem with the "new" magnet geometry and the sts\_allstrips\_full geometry. Using this two

together results in illegal overlaps of parts of the last STS station and the magnet.

Since we normally only check the standard setup, every user who uses different setups should check the geometry for overlaps.

Ciao

Florian
