Dear chamber builders,
we looked at several chambers and tested the anode connection. Unfortunately we have some more chambers where anode breaking was a problem. Therefore I believe that a test of the connection of the anode wires at a late stage (when really nothing can happen anymore, so consequently just before closing the chamber) is absolutely mandatory.

I believe that with the appropriate care this problem can be prevented (we managed to build the last 2 chambers without this problem), but still it should be checked in any case.

cheers,

Clemens
