Dear chamber builders,

we looked at several chambers and tested the anode connection. Unfortunately we have some more chambers where anode breaking was a problem. Therefore I belive that a test of the connection of the anode wires at a late stage (when really nothing can happen anymore, so consequently just before closing the chamber) is absolutly mandatory.

I belive that with the appropriate care this problem can be prevented (we managed to build the last 2 chambers without this problem), but still it should be checked in any case. cheers.

Clemens
