Dear Sussana and Lia,
i have a more general
question concerning the problem with low momentum particle.

I know from Alessandra Filippi who is working for FINUDA experiment, that she has implemented some changes in geant in order to be able to track low momentum particle (specially interesting for hypernuclei decay products). These changes have been performed in the ertrch routine of geant. You can take a look in the new version of vmc geant root 5.23.02

<https://lxbuild091.cern.ch/svn/geant3/trunk/erdeckes/ertrch.F>

Is it possible to check that for the low momentum particles?

thanks in advance
A. Sanchez.
