Dear Sussana and Lia, i have a more general question concerning the problem with low moemntum particle.

I know from Alessandra Filippi whis is working for FINUDA experiment, that she has implemented some changes in geane

in order to be able to track low momentum particle(specially interesting for hypernuclei decay products). This changes have been performed in the ertrch rutine of geane. You can take a look in the new version of vmc geant root 5.23.02

https://lxbuild091.cern.ch/svn/geant3/trunk/erdecks/ertrch.F

Is it possible to check that for the low momentum particles?

thanks in advance A. Sanchez.
