Hi,

this issue is very old, but still not solved. When cmake is executed if anyone changes a CMakeLists.txt, I end up with /usr/lib and /usr/local/lib in my LD_LIBRARY_PATH. This way, I end up using my system wide installation of geant3, instead the one from the external packages, which is further down the LD_LIBRARY_PATH variable. So, this should be removed. And having /usr/lib in the LD_LIBRARY_PATH is not good for anything anyway.

Please fix this!! If I would add up all the time in my life I spent on fixing this issue after a make, I could probably be much more advanced on that novel I have always been writing on

Cheers, Christian
