ahum...

yes, I found some problems on a Suse enterprise system at KVI. In config.sh:

```
export Linux_Flavour_="Welcome to SUSE Linux Enterprise Server 10 SP2 (x86_64) - Kernel  
r ( l)."  
export System_="x86_64"  
. /home/panda/pandaroot/build/check_system.sh
```

... looks like he messed up the "Linux_Flavour_" afterwhich the check_system.sh exits. I am also not so happy with the very aggressive exit in the check_system.sh script. For example, on the system at KVI, I couldn't login anymore, since I normally run the config.sh via .bash_profile script during logon. Well, you can imagine what happens if it doesnt work and exits..... Is a default warning not enough?

Gruesse,

Johan.
