Hi,

no, if you have these errors all the time, I believe that you can not have any sensible results. It is a kind of badly handled failed propagation. With the new interface to Geane we could catch these failures now in FairGeanePro, right Lia?

I dont see these errors in genfit in 32bit. But they can be there, I guess. Could you try to isolate in which cases it happens (low momenta, some special track angles, ....)?

Cheers, Christian
