Dear DCH experts,

I have one question for preparing kalman fitting and dch Kalman task  
A function of PndDchPrepareKalmanTracks() creates and initializes Tracks and is a pre-step  
for genfit and kalman task can be made with function PndDchKalmanTask().

There are 2 different version with PndDchKalmanTask and PndDchKalmanTask2.  
Is there some historical reason for preparing two different function with different name?  
I think version 2 is the default and much better to use.  
Could you confirm about it?

Thank you
