Subject: Dch tracking in forward spectrometer Posted by donghee on Sun, 24 May 2009 15:15:35 GMT View Forum Message <> Reply to Message

Dear DCH experts,

I have one question for preparing kalman fitting and dch Kalman task A function of PndDchPrepareKalmanTracks() creates and initializes Tracks and is a pre-step for genfit and kalman task can be made with function PndDchKalmanTask().

There are 2 different version with PndDchKalmanTask and PndDchKalmanTask2. Is there some historical reason for preparing two different function with different name? I think version 2 is the default and much better to use. Could you confirm about it?

GSI Forum

Thank you
