Subject: Fitter Exceptions
Posted by Aleksandra Wronska on Thu, 04 Jun 2009 12:35:56 GMT

Dear Genfitters,

I have another wish to the wish-list for genfit. During my recent simulations when using Genfit I quite often had a break and exit caused by two fitter exceptions: "low momentum" and "small theta" ones. I suggest that in the "lazy" mode the occurence of these should not cause interruption of the program, but proceeding to the next track, with assignment of statusflag=1 for the abandoned track.

Can you introduce it if it does not contradict with the exception philosophy somehow? So far I did it for my own, but I think it would be useful to have it in svn.

cheers,
ola
