Hi,

Sebastian introduced that flag (I never would call my code lazy ). The flag is supposed to ignore errors and go on with fitting. This only makes sense if errors are recoverable, like the `cov[0][0]==0` error. In your cases it does not make so much sense.

So, to conclude: If you want the fit to be aborted and the statusFlag to be set, do not activate the lazy flag, and the code will do what you want.

Cheers, Christian
