Hello Christian,

I have a bad feeling about storing pointers, mainly because I never do that. In my opinion you should store an index to the object in a TClonesArray. You would need one TClonesArray for each derived TrackPar class. This is the way it is done e.g. in the Mvd Digitization.

However, you are encouraged to make all the necessary changes to get it running!
For example moving the functionality of this Print() function to the daughter classes seems very convenient. The framework classes are write protected in svn anyway, so you have to distribute these on the development branch for a review.

Kind regards,
Ralf.
