The choice which transport engine to use is done in the simulation macro (see for instance macro/run/run_sim.C), by the method

```
void FairRunSim::SetName(const char* engine);
```

where engine can be "TGeant3", "TGeant4" or "TFluka" (the latter not recommended).

Geant4-related settings (physics and particle lists) must be implemented in gconfig/g4config.C
