Subject: Re: new features in GENFIT
Posted by StefanoSpataro on Mon, 29 Jun 2009 11:07:16 GMT

I am writing my PndTrack as genfit Track, before running the kalmanTask.
When I have to set the GeaneTrackRep, I have to set the detector plane as U and V.
When I have to take this detector plane from the PndTrack, in particular from FairTrackParP, what should I use? I can see many things inside:

GetIVer
GetJVer
GetKVer
GetV
GetW
GetTV
GetTW

but I am not so sure on what to use exactly as U and V (I have tried JVer and KVer but then I have a "Assertion `_u!=_v' failed.".
Which is the right element to use?
Thanks in advance
