Subject: Conversion of track parameters Posted by StefanoSpataro on Mon, 13 Jul 2009 09:54:19 GMT View Forum Message <> Reply to Message

Hello,

let's assume that I have one track represented by a parabula (FairTrackParP), and I want to convert it into a helix (FairTrackParH). What should I do exactly?

I have seen there is a class FairGeaneUtil doing conversions, but it is not using FairTrackPar objects, and for me SC SD Pt MARS are just ununderstandable acronyms.

Is there some function doing the covnersion in a simple way?
