Dear EMC experts,

I have seen that estimated energy with finding cluster in EMC is slightly overestimated.
You find related 3 plots in attached files.

MC true and reconstructed energy are compared in theta and momentum bin.
You can clearly see the overestimated energy in energy resolution 2D plot.

 EMC_g_mom_the_distribution.eps (red=MC, blue=reconstructed)
 EMC_g_energy_resolution_2D.eps
 EMC_g_theta_resolution_2D.eps

If I have a look for electron case, same amount of energy is also shifted.
I'm wondering how the calibration have been done. and how do we can correct wrongly
reconstructed energy in EMC.

Best regards,
Donghee
