Hello Mohammad and Florian,

when I tried to run the installation script I have observed the following error message:

```
scripts/set_compiler.sh: line 32: [: .: integer expression expected  
Could not extract the version of gfortran  
Stop script at this point
```

Looking in the set_compiler.sh script I found that among other issues it makes an analysis of the output text of the gfortran -v command. The problem is that I by default use the ru_RU.utf-8 encoding and the output looks a little bit different of what is expected.

To avoid in the future such an issue I would suggest to include in the text of the set_compiler.sh script the following lines:

```
default_lang=$(echo $LANG)  
LANG=en_EN.utf-8  
in the beginning (to set the needed encoding)
```

```
export LANG=${default_lang}  
at the end (to restore the default encoding)
```

I checked this correction - it works at least on my computer.

With the best regards,

Andrey Sokolov
