Hello Yuri, hello world!

The problem you described stems from the combination of X system and Qt on your machine. This has also been reported e.g. for fedora2 and SuSe9.1 systems.

Unfortunately, the Qtroot interface of Go4 <=v2.7 has problems with Qt versions >3.1 in connection with newer X11 libraries. This was caused by a wrong order of X-initialization calls that did not matter before, but shows up now(Qt-init before ROOT-init).

This is already fixed in the next Go4 v.2.8 which is going to be released within the next 2 weeks.

If you don't want to wait for the next release, we recommend to install and use Qt 3.1.1 to work with Go4 versions <=v2.7. (old Qt tarball is available on gsi linux after ". go4login pro" at \$QTDIR)

Best regards,

Joern
