Following the previous suggestions I have substituted, in FairTrackParP.cxx, all the:

```
fq = int(P * fQp)
```

with:

```
fq = (int)TMath::Sign(1.0, fQp)
```

Now the code does not crash anymore (with 200 events), then maybe the problem is solved.
Maybe this fix should be done even on the helix parameters...

I do not have the rights to write inside trackbase, therefore somebody else should do these changes and commit the code...
