Following the previous suggestions I have substituted, in FairTrackParP.cxx, all the:

fq = int(P * fQp)

with:

fq = (int)TMath::Sign(1.0, fQp)

Now the code does not crash anymore (with 200 events), then maybe the problem is solved. Maybe this fix should be done even on the helix parameters...

I do not have the rights to write inside trackbase, therefore somebody else should do these changes and commit the code...
