Hi,

I'm arriving more or less to the same conclusions, because the behaviour of the crashes is typical of a bad compilation.
To put GEANE in double precision requires to put the fortran statement IMPLICIT DOUBLE PRECISION (A-H,O-Z) in all the routines (Variables beginning with I,J,L,K,M,N are integers in FORTRAN). This could be done in a test version and after implemented in the CERNLIB.
We will try to do this

Alberto
