Subject: Re: failure of QA macro of EMC reconstruction Posted by Elwin Dijck on Sun, 06 Dec 2009 16:49:24 GMT View Forum Message <> Reply to Message

Good. I expect there can still be a small phi shift in some cases because the actual depth of showers is energy-dependent, while the depth used for reconstruction is constant. The default depth of 6.2 cm seems to work reasonably well, but I guess making this value energy-dependent at some point might further improve the reconstruction, especially at the lowest energies.
