Hi Mohammad,

Quote:

just for my curiosity, do you have any real use case for this? I thought you do not want to use macros at all, you wanted simply to compile these macros, and now you want to control even the sub-tasks (Which is by the way possible!) from the macros. It would be really great if all this would have a technical background and use cases and not simply like it is now!

the full reconstruction and analysis application for example will exist of a huge amount of individual tasks. To keep everything under control, it would be good/mandatory to set it up via an hierarchical structure, i.e. with sequences consisting of subtasks and subsubtasks. And such tasks are needed to be controled via an interpreter. Great, if this is possible with the existing application framework!

As I already mentioned before, one use case would be the high level analysis tools.

Cheers,
Bertram.
