After some discussions I wrote a new box generator inside pgenerators directory:
PndBoxGenerator.

PndBoxGenerator is like CbmBoxGenerator, but I put one function in order to set uniform distributions in $\cos(\theta)$, and not in θ as it is done by default.

Example:

If you want to have a unifor distribution i θ , you have to type in your simulation macro:

```
PndBoxGenerator* boxGen = new PndBoxGenerator(13, 1);
boxGen->SetPRange(1.,1.); // GeV/c
boxGen->SetPhiRange(0., 360.); // Azimuth angle range [degree]
boxGen->SetThetaRange(0., 180.); // Polar angle in lab system range [degree]
boxGen->SetXYZ(0., 0., 0.); // vertex coordinates [cm]
primGen->AddGenerator(boxGen);
```

IF you want to have a unifor distribution in $\cos(\theta)$:

```
PndBoxGenerator* boxGen = new PndBoxGenerator(13, 1);
boxGen->SetPRange(1.,1.); // GeV/c
boxGen->SetPhiRange(0., 360.); // Azimuth angle range [degree]
boxGen->SetThetaRange(0., 180.); // Polar angle in lab system range [degree]
boxGen->SetCosTheta(); // Set uniform ditribution in  $\cos(\theta)$ 
boxGen->SetXYZ(0., 0., 0.); // vertex coordinates [cm]
primGen->AddGenerator(boxGen);
```

And that's all.

Enjoy...

Ste

To show that the PndBoxGenerator works...

Comparison plots with the two methods:
RED - uniform θ

BLUE - uniform cos(theta)

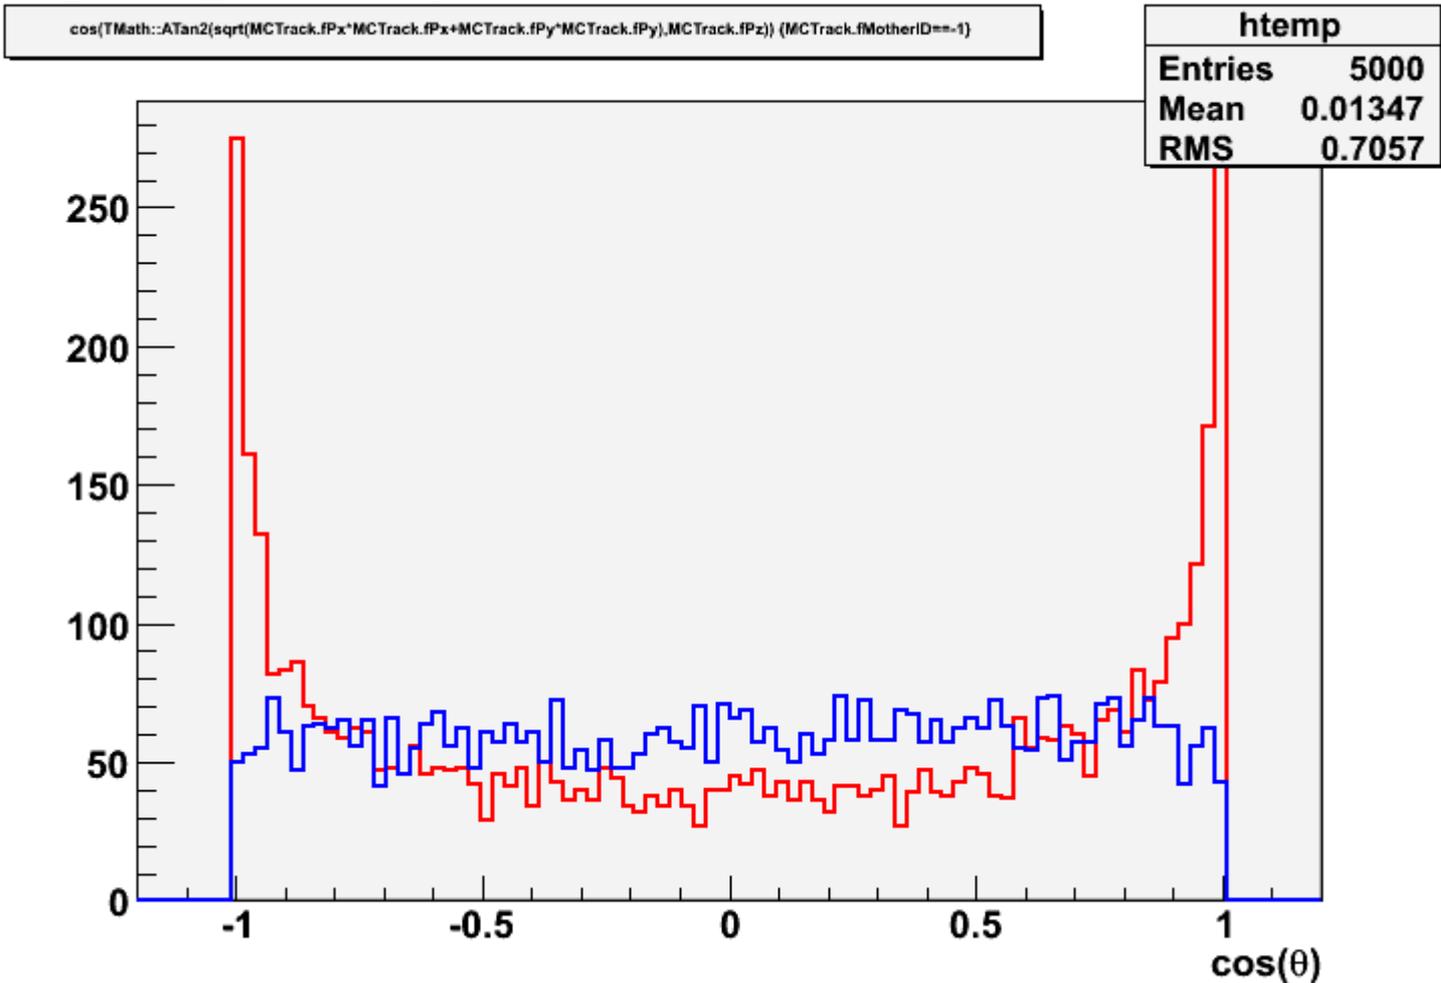

Theta distributions

Cos(Thata) distributions

Yes, it works!

Hello,

I added in PndBoxGenerator a new option, in order to have distributions uniform in 1/p (sometimes it can be useful).

It works as the CosTheta function, so (example):

```
PndBoxGenerator* boxGen = new PndBoxGenerator(13, 1);
boxGen->SetPRange(0.1,15.);
boxGen->SetPhiRange(0., 360.);
boxGen->SetThetaRange(1., 12.);
boxGen->SetXYZ(0., 0., 0.);
primGen->AddGenerator(boxGen);
```

generates particles with a uniform distribution over p in the fixed range, while if you add the boxGen->SetInverseP() function:

```
PndBoxGenerator* boxGen = new PndBoxGenerator(13, 1);
boxGen->SetPRange(0.1,15.);
```

```
boxGen->SetInverseP();  
boxGen->SetPhiRange(0., 360.);  
boxGen->SetThetaRange(1., 12.);  
boxGen->SetXYZ(0., 0., 0.);  
primGen->AddGenerator(boxGen);
```

you will have a distribution in the same range BUT uniform in $1/p$. It works even with pt range (so uniform in $1/pt$).

Enjoy.

P.S. meanwhile I corrected a missing initialization in the constructor, ad sone for CbmBoxGenerator.
