Here is a short note for you how to use the cmake:

A New build:

You starting point are the complete external packages and the source of pandaroot. It should look like this:

```
...fairroot/cbmsoft> ls  
cern configure.sh generators pandaroot SetEnv.sh tools transport
```

Now set the SIMPATH variabele, like:

```
cbmsoft/export SIMPATH=$PWD
```

Make an empty build directory. (name it as you want to)

```
cbmsoft>mkdir cbuild  
cbmsoft>cd cbuild
```

Generate the makefiles. (this replaces the reconf and configure from the automake-based way)

```
cbmsoft/cbuild>cmake ../pandaroot
```

Load the local enviroment.

```
cbmsoft/cbuild>./ config.sh
```

Begin compiling:

```
cbmsoft/cbuild>make install
```

Notes:

To run your macros on this build you have to load the cbuild/config.sh

[Edit: Mohammeds suggestion on the simpath added.]

Hi,

you do not really need the SetEnv.sh any more, all you need is the SIMPATH, So you can do  
export SIMPATH=(path to external packages i.e. cbmsoft/)  
then continue as Ralf described:

```
cbmsoft/cbuild>cmake ../pandaroot
```

Load the local environment.  
cbmsoft/cbuild>. config.sh

Begin compiling:  
cbmsoft/cbuild>make install

#### Notes

To run your macros on this build you have to load the cbuild/config.sh

Dear Ralf,

on my PC the described procedure to use cmake is not working. I always get the following error messages (just the beginning):

```
-- Check for working C compiler: /usr/bin/gcc
-- Check for working C compiler: /usr/bin/gcc -- works
-- Check size of void*
-- Check size of void* - done
-- Check for working CXX compiler: /usr/bin/c++
-- Check for working CXX compiler: /usr/bin/c++ -- works

Hi Tobias

I haven't seen anything like this error messages before.

I have no good idea what this could be so i only can guess.

Which version of cmake do you use?

You need at least version 2.4.3?

How old is your local copy of pandaroot?

If i interpret the error messages correctly your pandaroot

instllation is in the same directory as the external packages. Is this correct?

Can you try to install pandaroot somewhere else and try again.

How did you install cmake? On your own or did you use a tool provided by your linux distribution?

Up to now this are only questions and no answers, but i have first to understand what is going on.

Ciao

Florian

[View Forum Message](#) <> [Reply to Message](#)

Hi Florian,

I could partly solve the problem. Somehow the LD\_LIBRARY\_PATH variable was modified during compilation and all the path values pointed to an very old version. After rebooting my

Linux system (I always thought that this only helps on Windows machines ) cmake finishes now without errors. Unfortunately make still does not work. It stops immediately with the following error message:

```
Building CXX object base/CMakeFiles/Base.dir/CbmBaseContFact.o
cc1plus: error: unrecognized command line option "-ffriend-injection"
make[2]: *** [base/CMakeFiles/Base.dir/CbmBaseContFact.o] Error 1
make[1]: *** [base/CMakeFiles/Base.dir/all] Error 2
make: *** [all] Error 2
```

I am using cmake 2.4.6. This was installed from my SysAdmin on our local workstation cluster.

My local copy of pandaroot is at rev. 950.

I hope you have an idea what the reason for this problem is.

Ciao

Tobias

Hi Tobias

I think this problem i now well, since we had it on friday with cbm.

If i am correct you have a compiler version 4.0.? . If this is the case please update the main CMakeLists.txt.

The problem is that compiler flag -ffriend-injection is only known and needed from gcc version 4.1.0 I thought the flag is also needed for version 4.0.?, so i had an error in the check. This is corrected in SVN since revision 985.

Dear Florian,

the problem is fixed now. I updated to rev. 985 and it compiles.

Thank you for your help!

Hi Sebastian

There is a file missing/at the wrong place in your GEANT4 installation. In the subdirectory transport/geant4 below \$SIMPATH the file env.sh is missing. Copy the file from transport/geant4/source to transport/geant4.  
Then everything should work.

Ciao

Hello,  
I had this problem several weeks ago,  
maybe something wrong is happening in the installation of external packages.  
The next (if we will ever have a next release of external packages) release should fix this problem, I don't know in which machines it does happen (with my gentoo for sure).
