Hello everyone,

I have a problem compiling with cmake on the current svn version of pandaroot. I follow the standard procedure:

```
mkdir build  
cd build  
cmake ../../pandaroot  
. config.sh  
cmake install
```

but on the last step I get this error:

```
home/andrea/cbmsoft/pandaroot/build > cmake install  
CMake Error: The source directory "/home/andrea/cbmsoft/pandaroot/build/install" does not exist.  
Specify --help for usage, or press the help button on the CMake GUI.
```

I tried this on two machines with the same effect.

Things were working until last friday, when I did my last update.

Any idea?

Ciao,  
Andrea

Hi,

just type make install and not cmake install!

Silly me! Too much work

Thank you, Mohammad

Andrea
