Subject: radiation hardness tolerance of MVDdetectors Posted by asanchez on Tue, 05 Feb 2008 10:47:11 GMT View Forum Message <> Reply to Message

Dear all, i'm trying to evaluate the particle rate which will be loaded on the silicon strip detectors devoted for the hypernuclei project.As you probably know the silicon sensors will be similar to those used by you in the MVD detector.

The problem in my case is that i'm using a nuclear target instead of the hidrogen target used by PANDA(standard), and that can produce a high particle rate on the sensor.

So my question is what is the radiation hardness at which the microvertex is planned to work properly. I have taken a look into the TPR but i don't know if the number included there is already obsolet.

Could you tell me if there is more actual information concerning this issue.?

Thanks a lot best regards

ALicia.
