Hi all,

some more problems with EvtGen.

Based upon an observation by Irina.

With the new external packages under suse 10.3

using the EvtGen configuration "gcc, g77, (nothing), -IRIO -ISQL -INet" (which works fine the old external packages) it now starts searching for 64-bit include files (which I don't have on my 32-bit notebook). But there is nothing in the config.mk which could be changed (i.e. there is no 64-bit path in the config.mk).

```
soeren@pchad23:~/panda/pandaroot/trunk/pgenerators/EvtGen> make
Checking makedepend in EvtGen
make: *** No rule to make target `/usr/include/x86_64-linux/i386-linux/gnu/stubs.h', needed by
`cgFinder.o'. Stop.
```

Any idea how to fix it?

P.S. Stefano can you maybe also put the solution for Irina's EvtGen "missing libshift" problem into the wiki? (also suse 10.3).

And who actually put the "EvtGen: use gfortran as your c++ compiler(!) if you don't have g77" into the wiki. it seems to work(!) but we still don't understand why.

cheers, Soeren

It seems the last updated makefile have the local paths of Johan computer, where /usr/include/x86_64-linux exists.

You could try to remove all the stuff in Makefile starting from line 63 (cgfinder.o...), leaving the empty line. And you should try to remove the additional lines in the same way in EvtGenModels/Makefile and EvtGenBase/Makefile

First I should know what is the problem. I think Irina's problem was gfortran, which is not supported by EvtGen

It did not work in my case (Gentoo), and neither in Irina's.

Hi Soeren, hi Stefano,

indeed, Johan added (14.08) into Makefile for EvtGen 2 links: -lMathCore -lThread and sent it to svn.

After that, EvtGen compiled.

Regards,
Ola.

Yes,
but he forgot to remove all his local stuff in the Makefile.

I put the information on gfortran into the wiki page.

This idea is coming actually from Andrei and works for our Suse 10.2 and 11 installations but I have no idea why it works.

Cheers,

Tobias

The bug is now solved in svn, I have removed Johan's lines in the Makefile.

Hi,

The problem is simply due to the fact the dependancy in EvtGen are written to the same Makefile. In my case I just call the configure, then make depend in the main directory, EvtGenModels and EvtGenBase, and everything works fine!

So maybe we should re-write the makefiles in a proper way?

Mohammad

Hi all,

I would suggest to even include the EvtGen compilation into the common compiling process (as shell script or similar). Would it hurt?

Ciao, Ralf.

This was already done.

Added:

The Makefiles of EvtGen were rewritten in the proper way, in svn, without the local lines.

But once you call the configure, they are updated with your local stuff. Of course one should commit code in svn without these additions.

A lot of time ago we have agreed to have not EvtGen in the common compiling process, because it is difficult to maintain for the CERNLIB and other things. Of course we can change this policy, to have it in the Dashboard somehow.
