Hello,
if I read the media_pnd.geo file, about the "iron" media definition, I find:

iron   1 55.847 26. 7.87
                1 1 20. .001
                0

The question is: why iron is a "sensitive" volume? Is somebody using iron for his detector, to have MCPoints?
