Dear all,

I try to install pandaroot in SLC4.
I found a small bug at the library part, namely, libBase.so.0.0.0.

```
-----  
[100%] Built target Lumi  
Install the project...  
-- Install configuration: "Debug"  
CMake Error at base/cmake_install.cmake:42 (FILE):  
  file INSTALL cannot find file  
  "/afs/cern.ch/user/d/donghee/d86/buildpanda/lib/libBase.so.0.0.0" to  
  install.  
Call Stack (most recent call first):  
  cmake_install.cmake:37 (INCLUDE)  
  
make: *** [install] Error 1  
-----
```

Then I'm going to pandaroot/base, make an extra procedure
>cd base
>make

```
-----  
Linking CXX shared library ../lib/libBase.so  
[100%] Built target Base  
-----
```

After this, the library file, libBase.so is appeared! It looks fine.
Is it no problem? or is this some potential source of creating problem?

Thank you!

Hi,
I think you have used "make install", and that gave you the error message.
"Make install" is not used anymore, if you type just "make" will be enough.
Regards
