Hello,

I have discovered a serious problem in our full simulation: So far, in the last few days I have only done short simulations with a limited number of events, never more than about 50. Now, after doing a little bit more, I was very surprised that the simulation suddenly crashed. I think the reason is in some way related to an error in the digitization run:

```
DIGI EXECUTION *****
Hit array contains 56 hits
PndEmcMakeCluster, event: 81
***** PndEmcMakeBump, event: 81 *****
Digi at (250, 262) was a local max. Energy = 0.822928
Digi at (248, 281) was a local max. Energy = 0.260981
Digi at (234, 249) was a local max. Energy = 0.507599
EMC header: fired crystals= 56, digi= 31, Total energy= 2.13144 [GeV], Reconstru
cted clusters= 4, Total energy in clusters= 2.10211 [GeV]
-I- PndSttTrackFinderIdeal: all 114, acc. 1, rec. 1
-I- PndSttMatchTracks: rec. 1, quota 100 %
FIT xy *****
hitcounter: 8
Error in <TDecompLU::DecomposeLUCrout>: matrix is singular
-E- pre profit FAILED 0 24.8538
-I- PndSttHelixHitProducer: 0 track 8 SttHits, 8 HelixHits created.
```

-----  
This is followed by fitter exceptions and errors in the Kalman task:

```
FitterException thrown with excString:
findpca failure
in line: 354 in file: /home/cleitold/pandaroot/fairsoft/trunk/trackrep/GeaneTrac
kRep.cxx
with fatal flag 0
FitterException Info Output
*** S/R ERPROP IERR = 2
```

```
*** Error in subr. TRPROP 2 called bysubr. ERPROP
```

And then I end up with a tcands.root that does not contain a cbmsim tree. The problem occurs as soon as I do a simulation with about 80 to 100 events, even though it might not occur every time I run the simulation, so I suspect there might be a certain per-event probability for it.

Any ideas how to get rid of that kind of problems?

Thanks  
Christian

Can you please write the whole error message?

Alright, I have attached all the log files to this message. You might notice the out-of-bond errors in the sim log, but this error also occurs in successful simulation runs, not only in those which crash.

Do you have tracks in the fit file (after kalman)?

Well, there is a LheGenTrack branch in the fit file (attached).

Then the problem is that makeCand is trying to take information from LheGenTrack, even if it does not know how to do it.

I have said that LheGenTrack works with the new code, while makecand works with the good. At the moment you cannot use makeCand together with LheGentrack... you should go back to the svn release of the tutorial, you cannot use makeCand with the newest version before Klaus does fix it.

Ok, I went back to the revision 5813 from the tutorial. The original reco macro uses PndTpcLheTrackFinder/Fitter, even though we have STT instead of TPC here. If I turn that off, the Kalman task fails in finding the track array, and does not initialize. So, should I just keep using the PndTpcLheTrackFinder/Fitter?

In theory the kalman should work also with the old code. What is going wrong there?

Hi,

Stefano Spataro wrote on Fri, 04 September 2009 16:46 In theory the kalman should work also with the old code. What is going wrong there?

There was already a discussion about this or a similar crash with the tutorial revision. It is probably helpful to look at the threads:

[http://forum.gsi.de/index.php?t=tree&th=2535&start=0&rid=0&amp;S=5c35e1ea3b0a3b4d2958aa245cc31420#page\\_top](http://forum.gsi.de/index.php?t=tree&th=2535&start=0&rid=0&amp;S=5c35e1ea3b0a3b4d2958aa245cc31420#page_top)

and

<http://forum.gsi.de/index.php?t=tree&th=2540&start=0&rid=0&amp;S=5c35e1ea3b0a3b4d2958aa245cc31420>

Cheers,  
Bertram.

The first problem was coming from using a too new version of svn, and the solution was to sue the tutorial svn version.

I suppose the same solution applies to the 2nd thread, considering that was referring to a more recent svn version.

no, by going back to the tutorial revision the application crashed too. See:  
[http://forum.gsi.de/index.php?t=tree&goto=9199&rid=431&S=5c35e1ea3b0a3b4d2958aa245cc31420#msg\\_9199](http://forum.gsi.de/index.php?t=tree&goto=9199&rid=431&S=5c35e1ea3b0a3b4d2958aa245cc31420#msg_9199)

Cheers,  
Bertram.

Then I don't know,  
maybe Klaus could help, I have no idea on what is inside the tutorials macro, I know only the tracking code.  
Sorry.

The problem with the old code was, that there the classes used in the macro were PndTpcLheTrackFinder/Fitter. So my concern was, that this were the "wrong" ones since we are using STT here, ...

PndTpcLheTrack fitter is just the name of the class, but it works also for STT. What is important is to use the correct setup in the PndLheHitsMaker (SetSttMore(3), SetTpcMode(0)).

OK, then everything is set correctly here.

Hi,

I'm working on the necessary changes to the tutorials and rho to get it running in the newer revisions and hope to check in something to trunk tomorrow latest (cause I'll be away for a week then).

Don't know whether the crashes are related to wrong tutorial macros or rho, but I plan to get at least Fast Sim running to check the analysis part.

For the configuration of the detector modules I'm unfortunately no expert...

Cheers,

Klaus
