Dear pandaRooters,

with the new config.sh (without all the /usr/ links) I get a problem with the simulation macro. It complains that libxerces-c is missing. Adding /usr/X11R6/lib/ (necessary for eventdisplay) and /usr/lib/ to the LD_LIBRARY_PATH solves this problem.

Cheers,

Tobias

Hi Tobias

Normaly these two libraries are in the standard searchpath.

Obviously this is not true in your case. If you have root access on the machine please add the two libraries in /etc/ld.so.conf and then run ldconfig (man ldconfig). After that the problem should be gone.

If you don't have root access i don't know what to do. Some people have problems when including the pathes other people have problems without.

Ciao

Florian
