Dear pandaRooters,

a week ago a new scheme for the MC propagation was launched. It checks if data is transient or persistant and bypasses the MC links if this is necessary. In addition the description of the data type has changed with the new links.

The type of a link is now the branch name where the incoming data is stored in.

For some detectors I did already the modifications for others please change the type of the link from the DetectorList enum to the corresponding TString.

Please contact me, if you have any remarks or problems.

Cheers,

Tobias
