Subject: Trouble compiling FairModule starting from r13513

Hi,

I am using the trunk version of the external packages and I get compilation error on FairModule starting from revision 13513.
It sounds to be related to the fixing of the bug in Eta_c digitization, but I am not sure.
Am I doing something wrong? I do not find anything about that on the forum.
Just reverting FairModule to r13512 works, even if I get some warnings in running my macros.

Francesco

Hi,

What kind of error you get? and which external packages you use?

if you use something older than may11, then it could be that you are missing the GDML stuff in your root compilation. in case of jan10 or feb11 externals just go to your $SIMPATH and call svn update. This will update tools/rootconfig.sh. After that delete $SIMPATH/tools/root/bin/root.exe and run the configure.sh in $SIMPATH, this will reconfigure and build ROOT with gdml.

Regards

Mohammad

Thank you very much Mohammad,

indeed the issue was due to the old configuration of my ROOT, which was missing gdml.

Francesco
