---

Hello all,

probably, I am doing something wrong, but on my Ubuntu 12.04 64 bit system I cannot build fairroot jan 12. I called

```
./configure.sh
```

from the directory /home/fairroot/jan12 (created with svn co <https://subversion.gsi.de/fairroot/fairsoft/release/jan12>) and chose the following options:

```
1 - GCC
2 - Debug Info
1 - Don't Install
2 - Yes
```

I then entered /home/fairroot/buildjan12 (I created this folder beforehand and have read+write permission for it)

The error I get is:

Is /home/fairroot/buildjan12 the correct path?

```
1) No
2) Yes
3) Quit
```

Please enter a choice from the above menu: 2

*** ERROR: Geant3 could not be created.
*** End installation of external packages with Errors***
```

Note that there is no fairroot user on my system. I chose this path, however, because my home folder is on a separate hard drive and I want fairroot to save its files to the system disk.

Choosing "No" when asked

Quote:

Would you like to install all binaries, libraries etc. to a dedicated directory.  
The default is up to now 'No' which means that all created files will be in the source directories.

I run into the same problem.

Any help would be much appreciated.

Hi,

I think the problem is that geant3 was not downloaded by the svn checkout, can you please go to the /home/fairroot/jan12/transport/ and check that the geant3 directory exist? if not simply call svn update there.

Quote:Note that there is no fairroot user on my system. I chose this path, however, because my home folder is on a separate hard drive and I want fairroot to save its files to the system disk.

This does not effect anything here.

regards,

Mohammad

Thank you very much for your fast reply Mohammad.

There was a Geant3 directory in transport, but

svn update

said it was not a working copy. I deleted the directory, ran svn update again and now everything works. Thank you!
